## DECUS Program Library Write-up

DECUS No. 8-273

PURPOSE

The purpose of this is to modify the Phoenix Assembler so that it

- 1. will accept symbolic programs from the card reader;
- 2. will do all three passes automatically;
- 3. will load automatically after assembly;
- 4. will execute automatically provided no error is found in assembly. No binary tape is punched.

In general the system is supposed to operate without human intervention.

There are two patches assembled separately:

### PATCH 1

A number of pseudoinstructions were added to facilitate I/O instructions.

- 1. RDO Read octal. Four digit octal numbers are accepted from the keyboard into the AC. If digits 8 or 9 or more than four digits are entered, the error message "DE" (or data error) is typed and the monitor gets ready for the next job. Every octal number must be terminated by a comma. Spaces, line feeds and carriage returns are ignored. Negative signs are allowed.
- 2. RDA Reads the ASCII code of an alphanumeric character into the AC. Blanks and Rubouts are ignored. No terminating character is required.

These two pseudoinstructions occupy locations 6000 - 6077 and 2157 - 2175. The latter patch overlays the PAL III pseudoinstruction "FIELD."

On this patch there is also a routine that allows stopping a program in midstream and return to the monitor for the next job by 200 LOAD ADDRESS - START. This is important as the users can notice errors early and thus they do not want all three passes concluded to save time.

### PATCH 2

The first part of this patch is the CARD read unit which reads and loads the symbolic program on the card. Note here that the symbols for CR and LF are interchanged. This part takes up locations 6100 - 6141.

The second part is the program for the pseudo TYB - or type the contents of the AC as a 12 bit binary number. The AC is cleared after execution of TYB. This program takes up 6142 - 6163.

The most important part of this whole patch is the monitor. This monitor affects the automatic transition from pass to pass. It also checks for errors. If there are any, it will inhibit execution, typing the message "NO EXECUTION." It will also type the heading for a new job "ALGONQUIN ASSEMBLER." It will initiate execution of the loaded program. It will return to pick up a new job after the termination of the last one (pseudo STP will do it). The monitor occupies 6200 - 6260.

Locations 6261 - 6307 are for typing headings for the program listing.

The rest of this patch is a collection of patches onto the Phoenix Assembler. The remarks to these programs are self explanatory.

This patch also provides a number of pseudoinstructions which are to facilitate I/O.

TYO - Types contents of AC as a four bit octal number. AC = O after execution. No CR or LF given.

TYA - Types the character whose ASCII code is in bits 4 - 11 in the AC. The AC = O after execution. Again no CR of LF or space is given.

STP - This is equivalent to HLT. STP however does not stop the computer but returns the monitor to pick up the next job.

TYB - Types the contents of AC as a 12 bit binary number. AC = O after execution.

In the permanent symbol table five instruction symbols were replaced with the new pseudoinstructions.

 $PCF \rightarrow RDO$  2452  $PLS \rightarrow RDA$  2462

PPC→TYA 2456

PSF→TYO 2446

MMMM——>STP 2662

MMML→TYB 2672

The octal codes for these pseudos are:

RDO = 4524

RDA = 4427

 $\mathsf{TYA} = 4422$ 

TYO = 4431

TYB = 4452

STP = 5451

# Memory Map for the PHOENIX ASSEMBLER and the two patches"

### Note

1. The optical mark reader used with this system is the Hewlett-Packard 2761A.

A technical write-up on the interface and operating instructions of this reader is included.

- 2. This system was used for a whole year in teaching technicians computer fundamentals. We used it basically as a batch-processing system. Classes up to 50 students could write and run programs at the same time. Programs are easy to debug by changing incorrect cards and by rerunning the program. The cost of the reader is inexpensive (\$3,500) and the interface is easy.
- 3. A sample program is attached as well as the listings of the two patches.
- 4. In the complete ALGONQUIN ASSEMBLER binary tape provided, the first long part is the PHOENIX ASSEMBLER and the last two smaller parts are Patch 1 and Patch 2 referred to above.

## INTRODUCTION AND DESCRIPTION

# Introduction

This document provides interconnection and operating instructions for the DS-370 Marked Card Reader Interface.

# References

Hewlett-Packard - Manual for Model HP 2761A Optical Mark Readers.

Digital Systems Associates Limited - LD-370-F003.

# Description

The DS-370 Interface is an interface to the HP 2761A Optical Mark Reader for a PDP-8/S computer - the Reader which reads at a rate of 105 characters per second. It uses the existing interface of the ASR-33 with only a higher frequency clock and signal conditioning gates added.

A switch on the console selects either the Card Reader or ASR-33 input to the PDP-8/S, while output remains on the ASR-33.

### HARDWARE

### Connections

Input - Input to the system is the HP 2761A Optical Mark Reader and an ASR-33 Teletypewriter. The rotary switch on the console selects the appropriate clock and input signal to the existing interface.

Output - Output is accomplished on the ASR-33 in the form of punched paper tape and printed output.

## Operator Controls and Action

Since the computer has no direct control over the card reader, all cards in the hopper will be read by the reader. The operator must turn the card reader on and off manually. An example of a logical sequence of events is given below.

- a) Load card hopper with the number of cards to provide correct amount of data to be accepted by the PDP-8/S.
- b) Turn console switch to position marked CARD.
- c) Start program. Program will proceed and wait for flag from card readers.
- d) Push START button on reader.
- e) The cards will be read until the hopper is empty at which time push the STOP button. This will stop the reader and the program will continue until a halt is encountered.

CAUTION: STARTING THE READER GIVES CODE "0005." OPERATOR'S PROGRAM SHOULD TAKE CARE OF IT.

# Command Set

The card reader uses the same commands as the ASR-33 teletype reader.

# Performance Specifications

HP 2761A Optical Mark Reader
Option 04 - 40 column @ 105 character/sec.
Accessory 12841 - Hollerith Code, 64 characters.

The leading edge of the card produces an automatic CR, while the trailing edge produces an automatic LF.
